Aids with Inflammation  
Helps to Prevent Plaque  
Build up in Arteries

**BONES**  
Stimulate new bone growth while  
strengthening bones weakened  
from osteoporosis

**RELIEVE PAIN**  
Helps to reduce pain and inflammation  
in the body

CBD is an entirely different compound from THC (the part that gets you high), and its effects are very complex. It is not psychoactive, meaning it does not produce a "high" or change a person's state of mind, but it influences the body to use its own endocannabinoids more effectively.

The human body has an endocannabinoid system (ECS) that receives and translates signals from cannabinoids. It produces some cannabinoids of its own, which are called endocannabinoids. The ECS helps to regulate functions such as sleep, immune-system responses, and pain. CBD boosts your ECS - providing relief for sleep, pain and a multitude of other benefits.

Cannabinoids (found in the cannabis plant) are chemicals that trigger the cannabinoid CB1 & CB2 receptors in the brain and body, known as the endocannabinoid system.
